Powerful travelling cranes with capacities in excess of six tons operate on tracks on the New Mole and the military mole. Crawler cranes and fork hoists are used to transfer cargo from shipside to the cold storage warehouses across from the Cabotage Harbor quay. Among the floating cranes are a shearleg crane on a metal hull with lifting arms of 50 to 60 ton capacity and about ten mobile cranes on barges. Each crane is mounted on two barges connected by two sturdy squared beams about ten meters long. A bogie on which the cranes are mounted travels along these beams. These cranes seem particularly well suited for raising weights or vessels from the bottom. Since the death of Stalin informant has noticed a friendlier attitude with respect to crews of foreign ships. Contrary to previous practice, however, all ship's optical instruments, including binoculars, were placed under seal. The instruments were released prior to departure of the ship from the quay.
